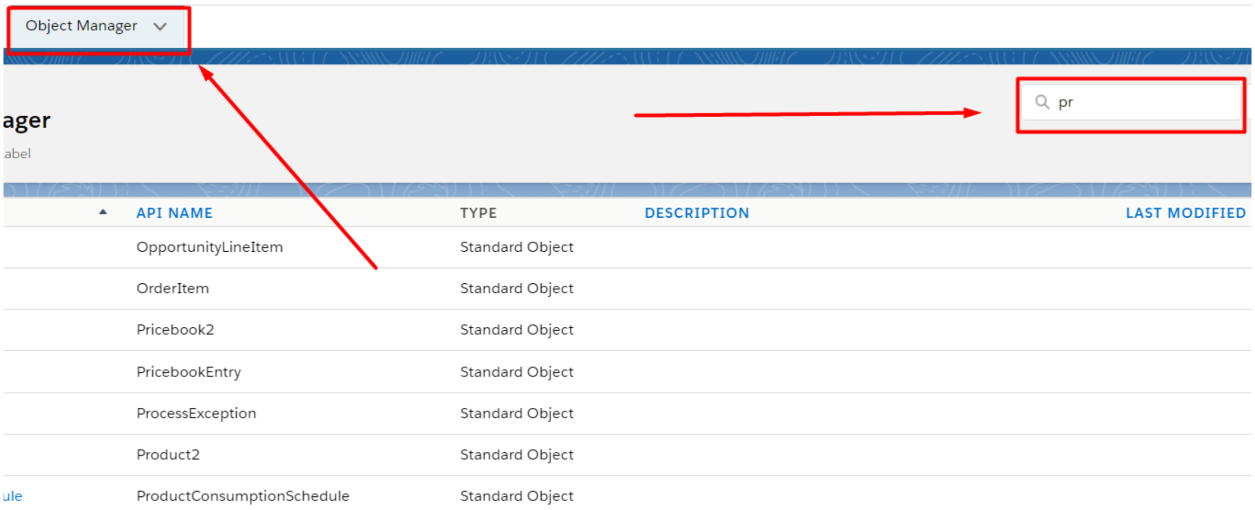
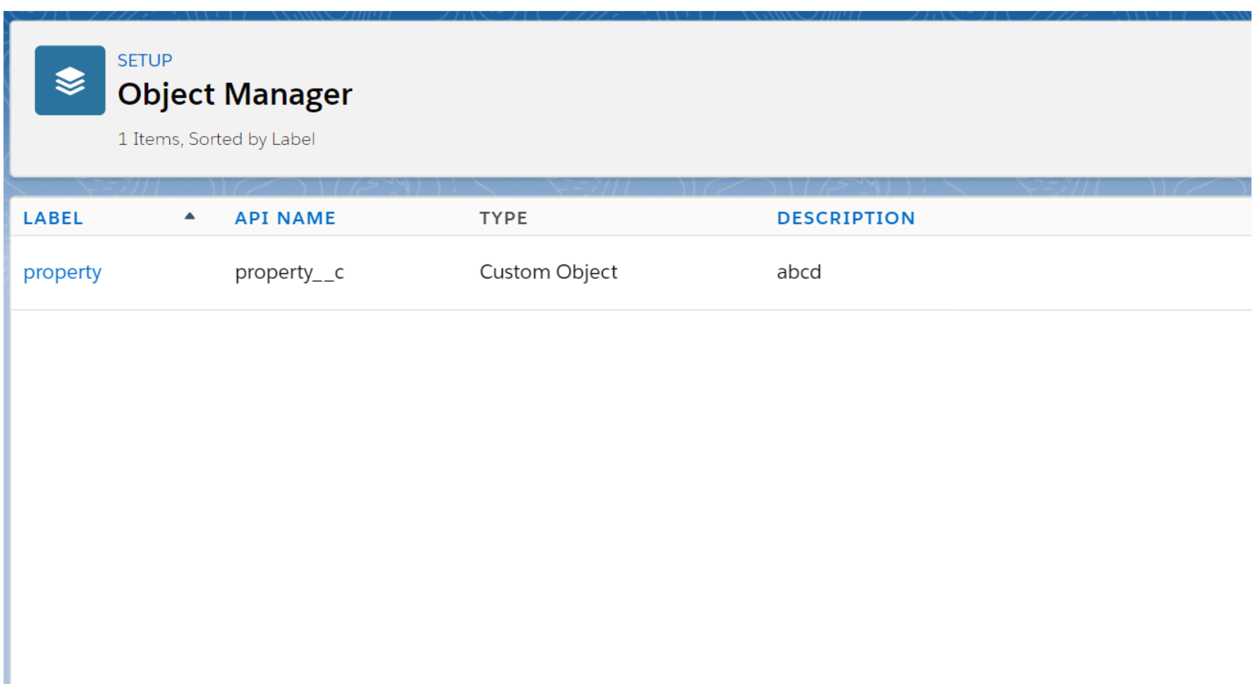
Lecture 2: Exploring our newly created Custom object
In this lecture we will explore our newly created custom object

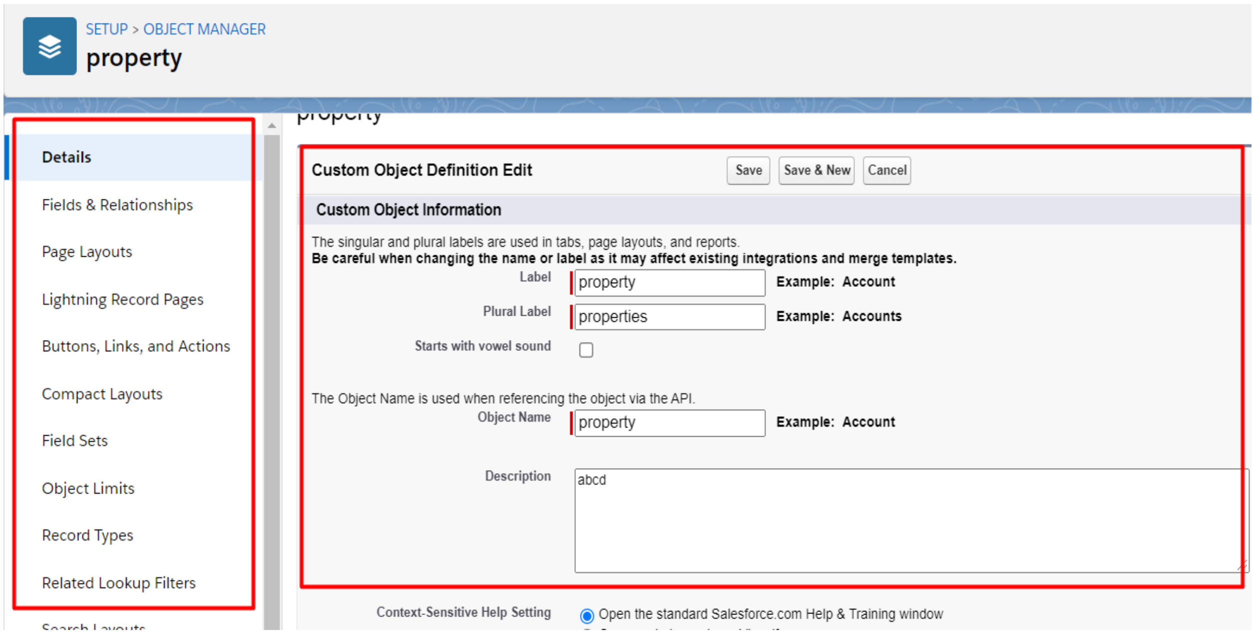
Step 1: As in the previous lecture we learned to create a custom object. In this lecture we will explore the custom object we created. In order to open our created custom object you have to go to object manager and search your custom object name.



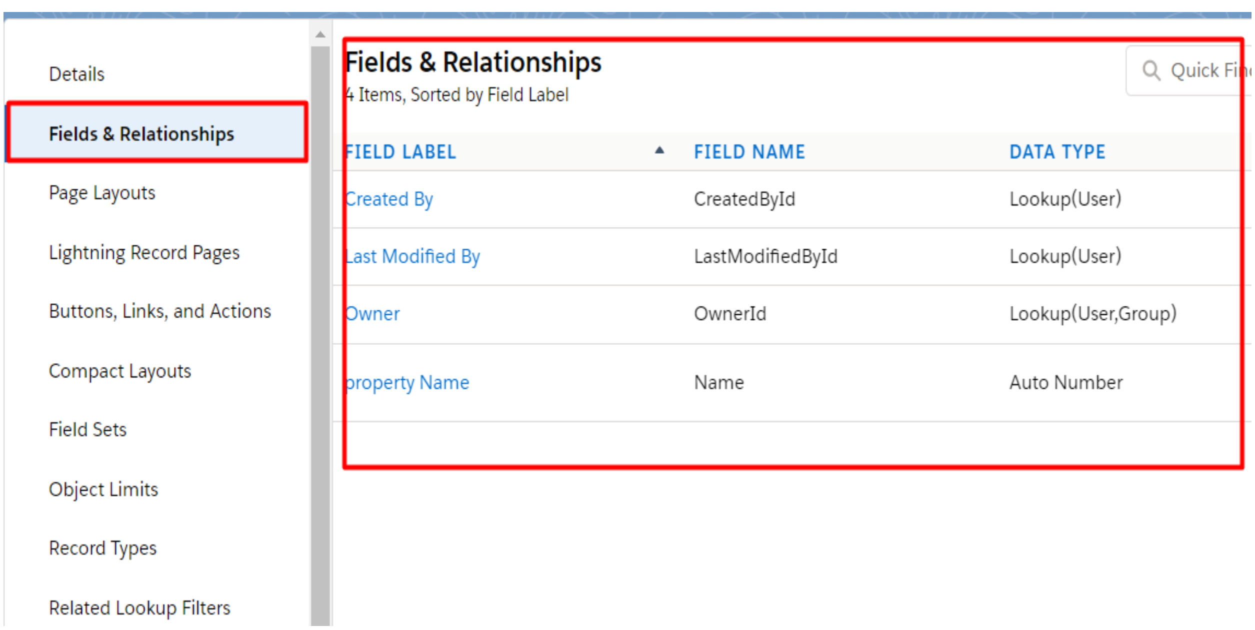
Step 2: When you search your custom object name you will find it in the list. You can see its date of creation, label, API name type and description.



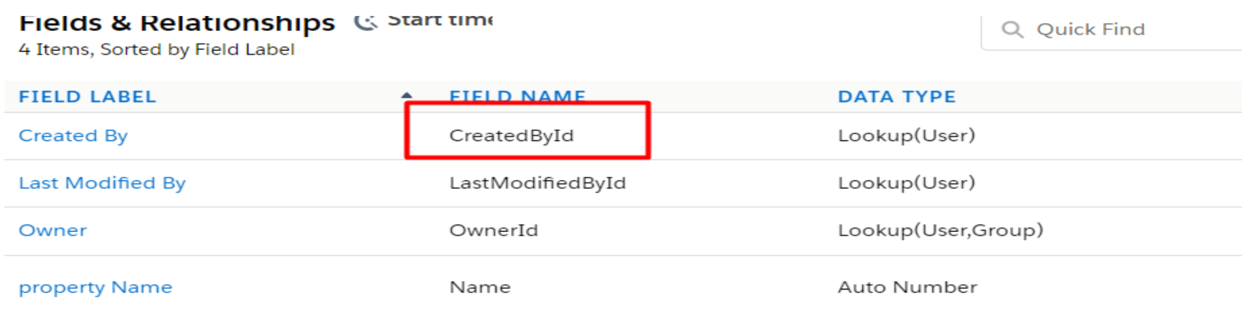
Step 3: In order to edit your custom object you can simply click on the arrow on the side of the custom object you created and click edit which will direct you to the next page reflecting all the related information to your custom object.



Step 4: If you want to create fields you can click on the fields and relationship option and add fields.



Step 5: As we know now that we have two types of objects standard and custom similarly we have two types of fields standard and custom fields and you can differentiate with the help of API names if a field has an API name with __c that is a custom field and if not that's a standard field.



Step 6: After fields lets move to the sales application and check whether the tab that we created is available for use or not . you can click on sales and then click on the more option present on the top right side to see if the tab is available or not.
